

ECE496 Project Snapshot

ASAP: Automated Social-media Aggregation Platform

Project ID	2026400
Students	Tianyu Ling, Shengya Huang, Molin Zhang, Zhengfei Yu
Supervisor	Hans-Arno Jacobsen

Motivation

- MSRG currently uses a third-party service to display social-media posts in its website's News section.
- The current solution works, but MSRG has limited control over how content is collected, filtered, and displayed.
- ASAP will provide an open-source system that MSRG can control, maintain, and extend.

Goal

Build an extensible platform that automatically collects and presents relevant social-media content on the MSRG website.

What We Will Build

- **Collect:** retrieve posts from LinkedIn, X, and Bluesky.
- **Unify:** convert content from different platforms into one common format.
- **Curate:** filter and organize the content that should appear in the feed.
- **Display:** present the final feed directly on the MSRG website.
- **Extend:** keep provider-specific code separate so new platforms can be added later.
- **Support:** include automated tests, Docker deployment, and documentation.

Anticipated Outcome

- A working open-source replacement for the current third-party MSRG News feed.
- A curated feed using content from the target social-media platforms.
- A Docker-based system that future students can maintain, extend, and reuse on other websites.
